PREFACE.....	7
CHAPTER 1. STOCHASTIC MODELS AND RHYTHM-ADAPTIVE INFORMATION TECHNOLOGY OF BIOMEDICAL CYCLIC SIGNALS PROBABILITY STRUCTURE IDENTIFICATION	13
1.1. Model-based, data-driving and the hybrid paradigms identification of the probability structure of cyclic biomedical signals.....	13
1.2. Cyclic random process and cyclically correlated random process.....	19
1.3. Vector of cyclically correlated rhythmically connected random processes and vector of cyclic rhythmically connected random processes	23
1.4. Rhythm-adaptive methods of statistical processing of a cyclic random process and a vector of cyclic rhythmically connected random processes	27
1.5. Estimation of the rhythm function of cyclic stochastic signals.....	31
1.6. Rhythm-adaptive discretization of a cyclic random process.....	34
1.7. Rhythm-adaptive technology of spectral analysis of one-dimensional probabilistic characteristics of cyclic signals with a variable rhythm.....	37
1.8. Conclusions	40
CHAPTER 2. RHYTHM-ADAPTIVE TECHNOLOGIES OF ECG CHARACTERISTICS IDENTIFICATION IN BIOMETRIC AUTHENTICATION AND CARDIOVASCULAR DIAGNOSTIC SYSTEMS.....	41
2.1. A general approach to building information technologies for biometric authentication and medical diagnostics based on ECG.....	41
2.2. Advantages of rhythm-adaptive technologies for identification of ECG signals over non-rhythm-adaptive ones.....	41
2.3. Person authentication technology based on rhythm-adaptive processing of the ECG signals.....	49
2.4. Technology of medical diagnosis of arrhythmias based on rhythm-adaptive processing of the ECG signals	59
2.5. Conclusions	61
CHAPTER 3. RHYTHM-ADAPTIVE TECHNOLOGIES OF EEG CHARACTERISTICS IDENTIFICATION IN NON-INVASIVE BRAIN-COMPUTER INTERFACES	63
3.1. A general approach to building non-invasive Brain-Computer Interfaces.....	63
3.2. Mathematical model and methods of processing EEG signals in BCI systems.....	64
3.3. Results of studies of statistical characteristics of vector EEG	69
3.4. Classification results	81
3.5. Conclusions	86

CHAPTER 4. MULTI-SENSOR ANALYSIS OF COGNITIVE SIGNALS FOR NEUROLOGICAL DISORDERS AND DISEASES.....	87
4.1. Development Methodology multi-sensor analysis of cognitive signals of abnormal neurological movement	87
4.2. The digital ANM trajectory of a patient's limb movement	88
4.3. Hybrid mathematical model for the analysis of the ANM of the tremor-object based on feedback of cognitive signals of EEG multisensors of the neural nodes of the core cerebral	89
4.4. The matrix algorithm for the ANM adaptive coefficients identification ...	93
4.5. Computational analysis of ANM and the cerebral cortex signals	94
4.6. Methodology for creation of analytical solution of Hybrid mathematical model ANM based on feedback of cognitive signals of EEG multisensors of the neural nodes of the core cerebral (detailed description)	100
4.7. Identification methodology of ANM amplitude components. Inverse heterogeneous boundary value problem taking into account the cognitive feedback-influences of the neuro-nodes of the CC (micro level).....	103
4.8. Spatial visualization of the results of digital analysis of the ANM trajectory of the T-object	105
4.9. Modeling and identification of parameters of complex multicomponent convective feedback systems on multicore computers (micro level)	108
4.10. Conclusions	112
CHAPTER 5. THE MATHEMATICAL METHODOLOGY OF MATRIX HYBRID INTEGRAL TRANSFORMATIONS FOURIER FOR CREATION OF ANM-MODELS.....	113
5.1. Finite integral Fourier transformations with spectral parameter for soft homogeneous media	113
5.2. Matrix finite hybrid integral Fourier transformations for limited heterogeneous n-component media	122
5.3. Conclusions.....	139
CHAPTER 6. A MATHEMATICAL METHODOLOGY OF MATRIX FINITE HYBRID INTEGRAL TRANSFORMATION FOR HETEROGENEOUS N-COMPONENT CYLINDRICAL MEDIA.....	141
6.1. A matrix finite hybrid integral transformation of the Hankel type of the second kind for limited heterogeneous n-component cylindrical media	141
6.2. A matrix finite hybrid integral transformation of the Fourier – Bessel for unlimited heterogeneous n-component cylindrical media	147
6.3. Conclusions.....	158

CHAPTER 7. MATHEMATICAL MODELING OF COMPETITIVE ADSORPTION AND DESORPTION OF GASES IN NANOPOROUS MEDIA USING LANGMUIR'S EQUILIBRIUMS.....		159
7.1.	Analysis of complex co-adsorption systems and processes in nanoporous media to solve the reducing of carbon emissions into the atmosphere and solving of the global warming problems	159
7.2.	Physical justification of the problem with the use of NMR analysis results	160
7.3.	A mathematical model of competitive co-adsorption in microporous solids	162
7.4.	Mathematical model of nonisothermal adsorption and desorption systems in a nanoporous particles media.....	165
7.5.	The scheme of nonlinear model linearization and construction of a linearized problems system solution	166
7.6.	Conclusions	176
CHAPTER 8. METHODS AND HIGH-PERFORMANCE TECHNOLOGIES OF MODELING AND IDENTIFICATION OF COMPLEX MULTI-COMPONENT SYSTEMS AND PROCESSES		179
8.1.	High-performance computing for incorrect problems	179
8.1.1	Modern paradigms of mathematical modeling	179
8.2.	Three-stage method of regularization for ill-posed problems	180
8.3.	Solving SLAE with a symmetric positive semidefinite sparse matrix	186
8.4.	Conclusions	189
References.....		193
