Preface

Introduction to aircraft structures

Aircraft structural components

Construction of structural components

Loads of airframe

Materials used for aircraft structures

Steel alloys

Magnesium alloys

Aluminum alloys

Titanium alloys

Polymer matrix composites

Metal matrix composites

Fiber-metal laminates

Sandwich composites

Trends in applicability of structural materials

Mechanics and failure of aircraft structures

Fundamentals on elasticity

Generalized Hooke's law

Anisotropic engineering elastic constants

Mechanics of laminated structures

Micromechanics of laminated structures

Constitutive relations of an orthotropic lamina

Classical lamination theory

Fundamentals on plasticity
Constitutive relations for generalized plasticity
Idealized models of plasticity
Fundamentals on viscoelasticity
Fundamental models of viscoelasticity
Boltzmann superposition principle
Yield and failure criteria for aircraft structures
Yield criteria for ductile aircraft materials
Failure criteria for advanced aircraft materials

Fundamentals on fracture mechanics

Introduction to fracture mechanics
Linear elastic fracture mechanics
Strain energy release rate concept
Basic crack extension modes
Linear elastic fracture of anisotropic materials
Elastic-plastic fracture mechanics
Simplified elastic-plastic fracture models
J-integral and related fracture criterion
Experimental determination of critical SERR values
Dynamic fracture
Mott's model
Stress field and SERR during dynamic fracture
Dynamic fracture criterion

Fatigue of aircraft structures

Fundamentals on fatigue
Fatigue process of materials
Models of fatigue fracture
Crack closure
Fatigue of composites
Fatigue fracture of polymers and polymeric composites
Fatigue fracture of fiber-metal laminates
Fatigue of joints
Threaded fasteners
Riveted joints

Welding joints
Adhesive joints
Environment-assisted fatigue
Environment-assisted fatigue and fracture of metals
Environment-assisted fracture of polymers and PMCs
Prediction of fatigue failure of aircraft structures

Defects and damage in aircraft structures

Design errors

Material and manufacturing defects

Microstructural inhomogeneity

Casting and forging defects

Sheet forming defects

Welding defects

Surface defects

Defects related to storage and manufacturing of PMCs

In-service damage

Damage of metallic structures

Damage of composite structures

Design philosophies of aircraft structures

Safe-life

Fail-safe

Damage tolerance

Design methodology

Fracture control

Damage tolerance aircraft requirements

Condition-based maintenance

Non-destructive testing and monitoring of aircraft structures

Non-destructive testing methods

Introduction to non-destructive testing

Visual testing

Penetrant testing

Magnetic testing

Eddy current testing

Acoustic testing

Ultrasonic testing

Vibration testing

Double pass retroreflection

Interferometric testing

Infrared thermography

Radiographic testing

Terahertz spectroscopy

Training and certification of NDT operators

Structural health monitoring methods

SHM systems based on elastic wave propagation

Vibration-based SHM systems

SHM systems based on acoustic emission

SHM systems based on electromechanical impedance

SHM systems based on embedded optical fibers

SHM systems based on electrical resistance

Other sensing technologies used in SHM

Aircraft structural repair

Introduction to aircraft structural repair

Structural repair of metallic aircraft structures

Welding and cold working repair

Sheet metal repair

Structural repair of polymeric and composite aircraft structures

Repair of cracks and holes in polymeric structures

Repair of damage in laminated composite structures

Repair of damage in sandwich structures

Materials used for repair of metal and composite structures

Testing and quality control of repaired structures
